

Task

Your task is to write a scrum (or kanban) board, with possibility to dynamically add columns. That means, that on the first opening there should be no columns at all, and those has to be added manually. Column has to have a title.

Column can be renamed or deleted. Columns can contain tasks.

Task can be added into any of the columns. Task itself has a title, which is displayed in the board. Title can be changed by opening task in a modal. Also, by opening task in modal, there will be possibility to add a description of a task.

Task can be dragged into different columns via drag'n'drop.

Task can be deleted.

Task can be accessed via tasks url, where information is displayed: title, description, column title in which task is now, time when task was created and when it was edited. Also task can be deleted in this page.

Requirements

Use react and redux.

Store all columns and tasks into localStorage.

Advanced

Possibility to add different scrum (or kanban) boards, with possibility to assign alises to them, by which board can be opened.

Example

Example boards can be found on any managed board solutions, for example asana.com
